

Full-Stack Web Development Roadmap

LearnHub SonaMilkii — Original Study Notes

Learning Objectives

- Understand front-end and back-end development.
- Learn a practical learning sequence.
- Understand how databases and APIs fit into web applications.

1. Front End

Front-end development creates the part of a website users see and interact with. HTML structures content, CSS styles it, and JavaScript adds behavior.

2. Back End

Back-end software handles business logic, authentication, data processing, APIs, and communication with databases.

3. Databases

Web applications commonly store users, content, transactions, and other information in databases. SQL databases use structured tables and relationships.

4. APIs

An API provides a defined way for software components to communicate. Web applications often use HTTP requests to send and receive data.

5. Learning Path

A practical path is HTML → CSS → JavaScript → Git/GitHub → a front-end framework → server-side development → databases → authentication → deployment.

Summary

A full-stack developer understands enough of the front end, back end, data layer, and deployment process to build and operate complete web applications.

Practice Questions

- What are the main ideas covered in Full-Stack Web Development Roadmap?
- Which concept was most useful to you, and why?
- Give one practical example of applying what you learned.
