

HTML Fundamentals

LearnHub SonaMilkii — Original Study Notes

Learning Objectives

- Understand HTML document structure.
- Use common semantic elements.
- Create links, lists, forms, and accessible content.

1. HTML

HTML (HyperText Markup Language) describes the structure and meaning of web content using elements and attributes.

2. Document Structure

A typical document contains a doctype, html element, head section for metadata, and body section for visible content.

3. Common Elements

Headings, paragraphs, links, images, lists, tables, and forms are common HTML building blocks. Semantic elements such as header, nav, main, section, and footer communicate structure.

4. Forms

Forms collect user input. Labels should be associated with controls, and input types should match the kind of data being requested.

5. Accessibility

Use meaningful headings, alternative text for informative images, labels for form controls, and descriptive link text.

Summary

HTML provides the semantic structure of a web page. CSS and JavaScript can then style and enhance that structure.

Practice Questions

- What are the main ideas covered in HTML Fundamentals?
- Which concept was most useful to you, and why?
- Give one practical example of applying what you learned.
